The App

The application works like a regular website. To run you need a local server with access to the Internet or a hosting.

Download app.zip from: https://github.com/VladULazarev/generate-numbers,

Unzip it into your project directory.

Or create your own local repository:

git clone hhttps://github.com/VladULazarev/generate-numbers.gitt

You need to create a database. Open the new DB and import the file app.sql.

The file is located in the root folder.

DB connection settings need to be edited in the file: core\DbConnection.php
After start you will see:

Next, you need to enter the minimum and maximum values for generating random numbers and click on 'Generate numbers'.

For example, if you enter 2 and 10 respectively, the nine random numbers will be generated and nine rows will be written to the table, where 'id' will be from 1 to 9, and random numbers from 2 to 10 will be written to the 'rand_num' column in the table.

The previous generation will be removed. To get a number, you need to enter any 'id' from 1 to 9 in the 'Retrieve a number by id' field.

The script will work if you enter at least one digit.
